

Master-seal

Modular sealing system for pipe and cable penetrations

Drykos® **Master-seal** is a modular mechanical sealing system designed for the watertight sealing of pipe, cable, and conduit penetrations passing through walls, floor slabs, wall sleeves, or core-drilled holes in concrete structures. The system consists of a modular chain formed by individual sealing modules, each composed of an EPDM rubber elastomeric element, reinforced polyamide pressure plates, and bolts with tightening nuts, available in V2A stainless steel or galvanized versions depending on the model.

The operating principle is based on the controlled compression of the elastomeric elements: the progressive tightening of the bolts generates the radial expansion of the rubber, which compresses simultaneously against the inner wall of the hole or sleeve and against the outer surface of the pipe or cable, creating a continuous, stable seal resistant to water pressure.

Drykos® **Master-seal** is particularly suitable for both new constructions and retrofit interventions on existing penetrations, thanks to the possibility of installing the chain even around pipes that have already been laid.

NOTES

This "light" version of the technical data sheet provides a selection of the product's main descriptive and performance characteristics. While the data contained herein corresponds to our current scientific and technical knowledge, it is indicative and not exhaustive. For complete specifications, detailed technical information, conditions of use, and official updates, please refer exclusively to the full technical data sheet, available in its latest revision at www.drykos.com.
