

Mastertube set

Injectable PVC tube for sealing construction joints

Drykos® **Mastertube** is a preformed injectable system for internal waterproofing of construction joints in concrete structures. The system consists of a PVC tube specifically designed to be installed along the joint line before the subsequent pour, allowing, if necessary, the subsequent injection of suitable resins for sealing discontinuities and preferential infiltration paths.

Once embedded in the concrete, Drykos® **Mastertube** provides a permanent provision for waterproofing intervention by injection, particularly useful in underground structures, hydraulic works, and all structures where the ability to subsequently intervene on the construction joint seal is required.

The installation set is supplied ready for installation and includes 10 m of injection tube, fixing accessories, installation clips, and connectors, to ensure a complete and organized application system on site.

NOTES

This "light" version of the technical data sheet provides a selection of the product's main descriptive and performance characteristics. While the data contained herein corresponds to our current scientific and technical knowledge, it is indicative and not exhaustive. For complete specifications, detailed technical information, conditions of use, and official updates, please refer exclusively to the full technical data sheet, available in its latest revision at www.drykos.com.
